

## MATH 3150 — HOMEWORK 2

**Problem 1** (p. 97, #5). Let  $x_n$  be a monotone increasing sequence bounded above and consider the set  $S = \{x_1, x_2, \dots\}$ . Show that  $x_n$  converges to  $\sup(S)$ . Make a similar statement for decreasing sequences.

*Remark.* This shows that the *least upper bound property* — that every nonempty set with an upper bound has a least upper bound — implies the *monotone sequence property* — that every monotone increasing bounded sequence bounded above converges. Combined with the reverse implication proved in class, it follows that the least upper bound property is equivalent to completeness.

**Problem 2** (p. 97, #7). For nonempty sets  $A, B \subset \mathbb{R}$ , let  $A+B = \{x+y \mid x \in A \text{ and } y \in B\}$ . Show that  $\sup(A+B) = \sup(A) + \sup(B)$ .

**Problem 3** (p. 52, #4).

- (a) Let  $x_n$  be a Cauchy sequence. Suppose that for every  $\varepsilon > 0$  there is some  $n > 1/\varepsilon$  such that  $|x_n| < \varepsilon$ . Prove that  $x_n \rightarrow 0$ .
- (b) Show that the hypothesis that  $x_n$  be Cauchy in (a) is necessary, by coming up with an example of a sequence  $x_n$  which does not converge, but which has the other property: that for every  $\varepsilon > 0$  there exists some  $n > 1/\varepsilon$  such that  $|x_n| < \varepsilon$ .

**Problem 4** (p. 99 #15). Let  $x_n$  be a sequence in  $\mathbb{R}$  such that  $|x_n - x_{n+1}| \leq \frac{1}{2} |x_{n-1} - x_n|$ . Show that  $x_n$  is a Cauchy sequence.

**Problem 5.** Prove that an Archimedean ordered field in which every Cauchy sequence converges is complete (i.e. has the monotone sequence property). Here are some suggested steps:

- (a) Denote the field by  $\mathbb{F}$ , and suppose  $x_n$  is a monotone increasing sequence bounded above by some  $M \in \mathbb{F}$ .
- (b) Proceeding by contradiction, suppose  $x_n$  is not Cauchy. Deduce the existence of a subsequence  $y_k = x_{n_k}$  with the property that

$$y_k \geq y_{k-1} + \varepsilon, \quad \forall k \tag{1}$$

for some fixed positive number  $\varepsilon > 0$  which does not depend on  $k$ .

- (c) Using the Archimedean property, argue that  $y_k$  cannot be bounded above by  $M$ , hence obtaining a contradiction.
- (d) Conclude that  $x_n$  converges.
